Executive Summary

Summary of methodologies

Our approach encompassed a dual methodology involving API integration and web scraping techniques for data collection. Following the acquisition phase, we employed a suite of Python data manipulation methods to meticulously process and cleanse the dataset. Subsequently, SQL queries were employed to extract pertinent information from the refined dataset. Early insights were garnered through systematic data visualization and trend analysis. Concluding our analytical framework, we implemented supervised machine learning models to formulate predictions regarding the success of landing events. We applied supervised machine learning models to make predictions about the success of the landing event. Executive

Summary Summary of all results

Through meticulous data analysis, we identified discernible patterns and correlations among variables directly influencing the success of landing events. Leveraging these insights, we developed and trained a predictive model that demonstrated a notable capability to accurately forecast the probability of a successful landing event. Notably, the model achieved a commendable accuracy rate of 83%, underscoring its effectiveness in providing reliable prognostications within this domain.

Introduction

- SpaceX's commitment to reusable rockets has significantly mitigated space travel costs by strategically focusing on the retrieval of the first rocket phase. The recovery of this initial phase is paramount in preserving and reusing expensive components, contributing directly to cost reduction. An in-depth analysis of the success rate of these retrieval events serves as a valuable metric for evaluating efficiency and cost-effectiveness in SpaceX's pioneering approach. This particular project is geared towards predicting the success of the first phase retrieval event, thereby offering predictive insights aimed at enhancing decision-making within the space industry.
- Our objective is to forecast the success of first-phase rocket retrieval, with the overarching aim of optimizing resource allocation. By achieving this predictive capability, we seek to enhance mission success rates and contribute to substantial cost savings.

Methodology

Executive Summary

- Data collection methodology:
 - Describe how data was collected
- Perform data wrangling
 - Describe how data was processed
- Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models
 - How to build, tune, evaluate classification models

Data Collection

Describe how data sets were collected:

Data was first collected using SpaceX API (a RESTful API) by making a get request to the SpaceX API. This was done by first defining a series helper functions that would help in the use of the API to extract information using identification numbers in the launch data and then requesting rocket launch data from the SpaceX API url.

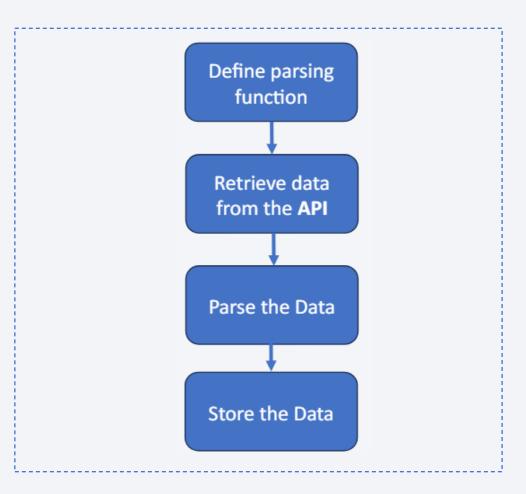

Finally to make the requested JSON results more consistent, the SpaceX launch data was requested and parsed using the GET request and then decoded the response content as a Json result which was then converted into a Pandas data frame.

Also performed web scraping to collect Falcon 9 historical launch records from a Wikipedia page titled <u>List of Falcon 9 and Falcon Heavy launches</u> of the launch records are stored in a HTML. Using BeautifulSoup and request Libraries, I extract the Falcon 9 launch HTML table records from the Wikipedia page, Parsed the table and converted it into a Pandas DataFrame.

You need to present your data collection process use key phrases and flowcharts

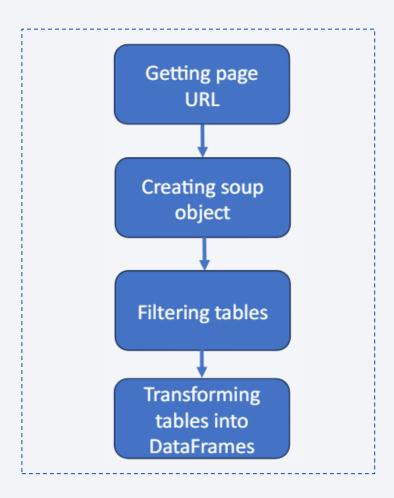

Data Collection – SpaceX API

- 1. Define auxiliary function to parse the data.
- 2. Retrieve data from the REST API using the method GET.
- 3. Parse the data with the previously built auxiliary functions.
- 4. Store the data in PANDAS DataFrame.
- GitHub URL of the Spacex API calls notebook: Click here!

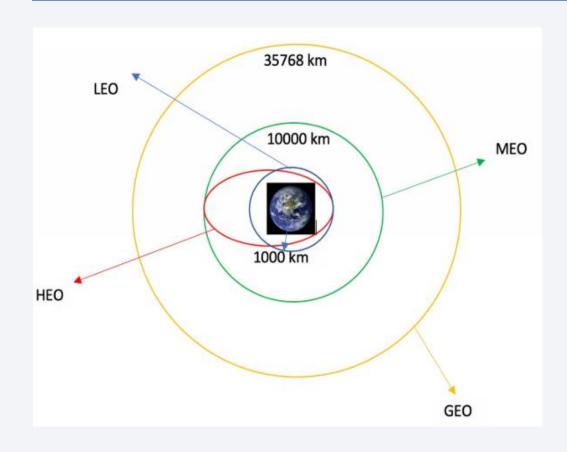

Data Collection - Scraping

- 1) Using the get request.get method to download page code.
- 2) Created a BeautifulSoup object to manipulate the html text.
- 3) Filtered the desired tables using soup manipulation methods.
- 4) Converted the data from the HTML to pandas DataFrame format
- GitHub URL of the completed web scraping: Click Here!

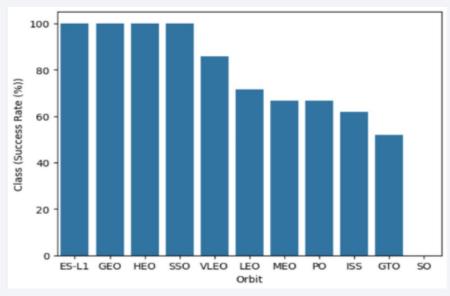

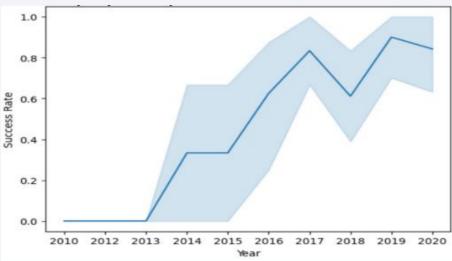

Data Wrangling

We performed exploratory data analysis and determined the training labels. We calculated the number of launches at each site, and the number and occurrence of each orbits We created landing outcome label from outcome column and exported the results to CSV.

EDA with Data Visualization

- We explored the data by visualizing the relationship between flight number and launch Site, payload and launch site, success rate of each orbit type, flight number and orbit type, the launch success yearly trend.
- For Github Notebook: Click Here!

EDA with SQL

- Using SQL, we had performed many queries to get better understanding of the dataset
- - Displaying the names of the launch sites.
- - Displaying 5 records where launch sites begin with the string 'CCA'.
- Displaying the total payload mass carried by booster launched by NASA (CRS).
- Displaying the average payload mass carried by booster version F9 v1.1.
- - Listing the date when the first successful landing outcome in ground pad was achieved.
- - Listing the names of the boosters which have success in drone ship and have payload mass greater than 4000 but less than 6000.
- Listing the total number of successful and failure mission outcomes.
- Listing the names of the booster_versions which have carried the maximum payload mass.
- - Listing the failed landing_outcomes in drone ship, their booster versions, and launch sites names for in year 2015.- Rank the count of landing outcomes or success between the date 2010-06-04 and 2017-03-20, in descending order.

Build an Interactive Map with Folium

We marked all launch sites, and added map objects such as markers, circles, lines to mark the success or failure of launches for each site on the folium map.

We assigned the feature launch outcomes (failure or success) to class 0 and 1.i.e., 0 for failure, and 1 for success. Using the color-labeled marker clusters, we identified which launch sites have relatively high success rate.

We calculated the distances between a launch site to its proximities. We answered some question for instance:

- Are launch sites near railways, highways and coastlines.
- Do launch sites keep certain distance away from cities.

Build a Dashboard with Plotly Dash

We built an interactive dashboard with Plotly dash.

We plotted pie charts showing the total launches by a certain sites.

We plotted scatter graph showing the relationship with Outcome and PayloadMass (Kg) for the different booster version.

Predictive Analysis (Classification)

We loaded the data using numpy and pandas, transformed the data, split our data into training and testing.

We built different machine learning models and tune different hyperparameters using GridSearchCV.

We used accuracy as the metric for our model, improved the model using feature engineering and algorithm tuning.

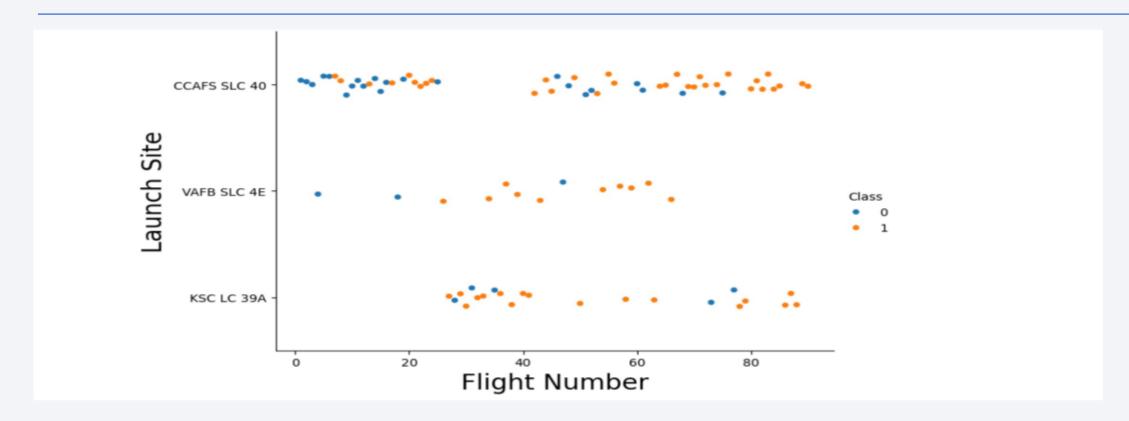

We found the best performing classification model.

Results

- Exploratory data analysis results
- Interactive analytics demo in screenshots
- Predictive analysis results

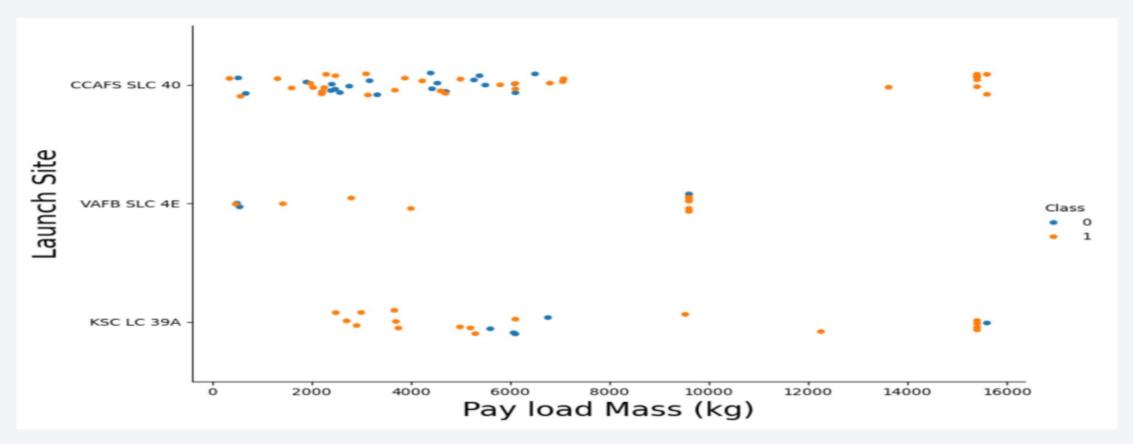

Flight Number vs. Launch Site

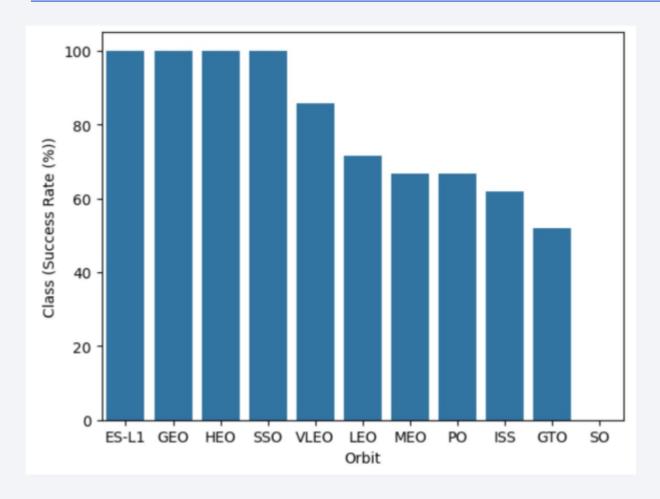

From the plot, we found that the larger the flight amount at a launch site, the greater the success rate at a launch site.

Payload vs. Launch Site

The greater the payload mass for launch site **CCAFS SLC 40** the **higher** the success rate for the rocket.

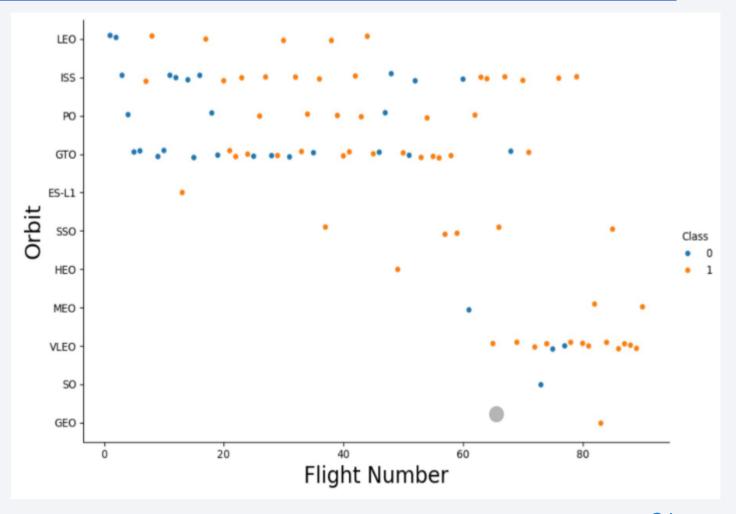

Success Rate vs. Orbit Type

• From the plot, we can see that ES-L1, GEO, HEO, SSO, VLEO had the most success rate.

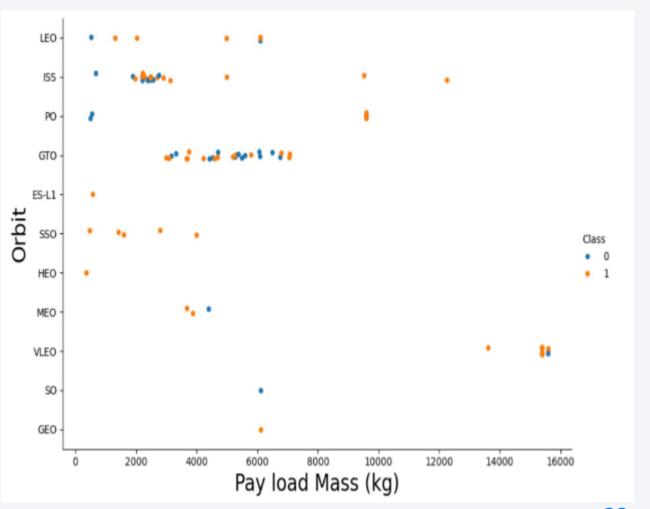

Flight Number vs. Orbit Type

• The plot below shows the Flight Number vs. Orbit type. We observe that in the LEO orbit, success is related to the number of flights whereas in the GTO orbit, there is no relationship between flight number and the orbit.

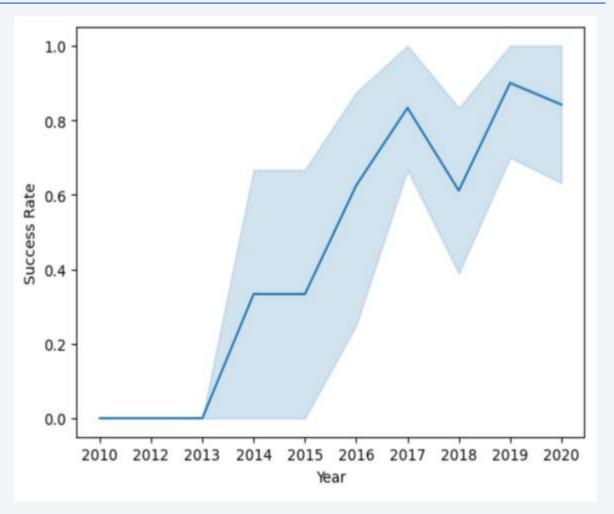

Payload vs. Orbit Type

 We can observe that with heavy payloads, the successful landing are more for PO,LEO and ISS orbits.

Launch Success Yearly Trend

• From the plot, we can observe that success rate since 2013 kept on increasing till 2020.

All Launch Site Names

• We used the key word DISTINCT to show only unique launch sites from the SpaceX data.

Launch Site Names Begin with 'CCA'

Displa	Display 5 records where launch sites begin with the string 'CCA'								
tsql	%sql SELECT * FROM 'SPACEXTBL' WHERE Launch_Site LIKE 'CCA%' LIMIT 5;								
* sql: Done.	* sqlite:///my_data1.db								
Date	Time (UTC)	Booster_Version	Launch_Site	Payload	PAYLOAD_MASSKG_	Orbit	Customer	Mission_Outcome	Landin _Outcom
04- 06- 2010	18:45:00	F9 v1.0 B0003	CCAFS LC- 40	Dragon Spacecraft Qualification Unit	0	LEO	SpaceX	Success	Failui (parachuti
08- 12- 2010	15:43:00	F9 v1.0 B0004	CCAFS LC- 40	Dragon demo flight C1, two CubeSats, barrel of Brouere cheese	0	LEO (ISS)	NASA (COTS) NRO	Success	Failui (parachuti
22- 05- 2012	07:44:00	F9 v1.0 B0005	CCAFS LC- 40	Dragon demo flight C2	525	LEO (ISS)	NASA (COTS)	Success	No attemį
08- 10- 2012	00:35:00	F9 v1.0 B0006	CCAFS LC- 40	SpaceX CRS-1	500	LEO (ISS)	NASA (CRS)	Success	No attem _l
01- 03- 2013	15:10:00	F9 v1.0 B0007	CCAFS LC- 40	SpaceX CRS-2	677	LEO (ISS)	NASA (CRS)	Success	No attemį

 We used the query above to display 5 records where launch sites begin with CCA.

Total Payload Mass

 We calculated the total payload carried by boosters from NASA as 45596 using the query below

Average Payload Mass by F9 v1.1

```
Display average payload mass carried by booster version F9 v1.1

In [19]: 
*sql SELECT AVG(PAYLOAD_MASS__KG_) as "Payload Mass Kgs", Customer, Booster_Version FROM 'SPACEXTBL' WHERE Booste 
* sqlite:///my_datal.db
Done.

Out[19]: 
Payload Mass Kgs Customer Booster_Version

2534.6666666666666 MDA F9 v1.1 B1003
```

• We calculated the average payload mass carried by booster version F9 v1.1 **B1003** as **2534.6666666666**.

First Successful Ground Landing Date

```
Task 5

List the date when the first succesful landing outcome in ground pad was acheived.

Hint:Use min function

In [21]: 
*sql Select MIN(DATE) FROM 'SPACEXTBL' WHERE "Landing _Outcome" = "Success (ground pad)";

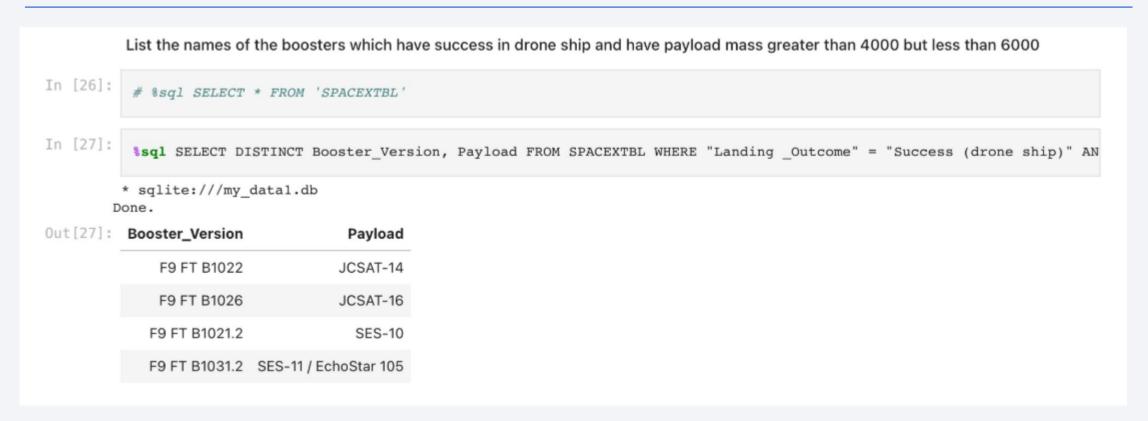

* sqlite://my_datal.db
Done.

Out[21]: MIN(DATE)

01-05-2017
```

 We observed that the dates of the first successful landing outcome on ground pad was 1st May 2017.

Successful Drone Ship Landing with Payload between 4000 and 6000

We used the WHERE clause to filter for boosters which have success fully landed on drone-ship and applied the and condition to determine successful landing with payload mass greater than **4000** but less than **6000**.

Total Number of Successful and Failure Mission Outcomes

• Total number of Mission outcome was a success or a failure.

Boosters Carried Maximum Payload

d PAYLOAD_N	Payloa	Booster_Version	Out[30]:
9	Starlink 1 v1.0, SpaceX CRS-1	F9 B5 B1048.4	
st	Starlink 2 v1.0, Crew Dragon in-flight abort te	F9 B5 B1049.4	
0	Starlink 3 v1.0, Starlink 4 v1.	F9 B5 B1051.3	
0	Starlink 4 v1.0, SpaceX CRS-2	F9 B5 B1056.4	
0	Starlink 5 v1.0, Starlink 6 v1.	F9 B5 B1048.5	
2	Starlink 6 v1.0, Crew Dragon Demo-	F9 B5 B1051.4	
0	Starlink 7 v1.0, Starlink 8 v1	F9 B5 B1049.5	
0	Starlink 11 v1.0, Starlink 12 v1.	F9 B5 B1060.2	
0	Starlink 12 v1.0, Starlink 13 v1.	F9 B5 B1058.3	
0	Starlink 13 v1.0, Starlink 14 v1.	F9 B5 B1051.6	
4	Starlink 14 v1.0, GPS III-0	F9 B5 B1060.3	
1	Starlink 15 v1.0, SpaceX CRS-2	F9 B5 B1049.7	

 We determined the booster that have carried the maximum payload using a subquery in the WHERE clause and the MAX() function.

2015 Launch Records

List the records which will display the month names, failure landing_outcomes in drone ship ,booster versions, launch_site for the months in year 2015.

Note: SQLLite does not support monthnames. So you need to use substr(Date, 4, 2) as month to get the months and substr(Date,7,4)='2015' for year.

		-						
In [68]:	[n [68]: %sql SELECT substr(Date,7,4), substr(Date, 4, 2), "Booster_Version", "Launch_Site", Payload, "PAYLOAD_MASSKG						MASSKG_",	
	* sqlite:///my_cone.	data1.db						
Out[68]:	substr(Date,7,4)	substr(Date, 4, 2)	Booster_Version	Launch_Site	Payload	PAYLOAD_MASSKG_	Mission_Outcome	Landing _Outcome
	2015	01	F9 v1.1 B1012	CCAFS LC- 40	SpaceX CRS-5	2395	Success	Failure (drone ship)
	2015	04	F9 v1.1 B1015	CCAFS LC- 40	SpaceX CRS-6	1898	Success	Failure (drone ship)

We used a combinations of the WHERE clause, LIKE, AND, and Between conditions to filter for failed landing outcomes in drone ship, their booster versions, and launch site names for year 2015.

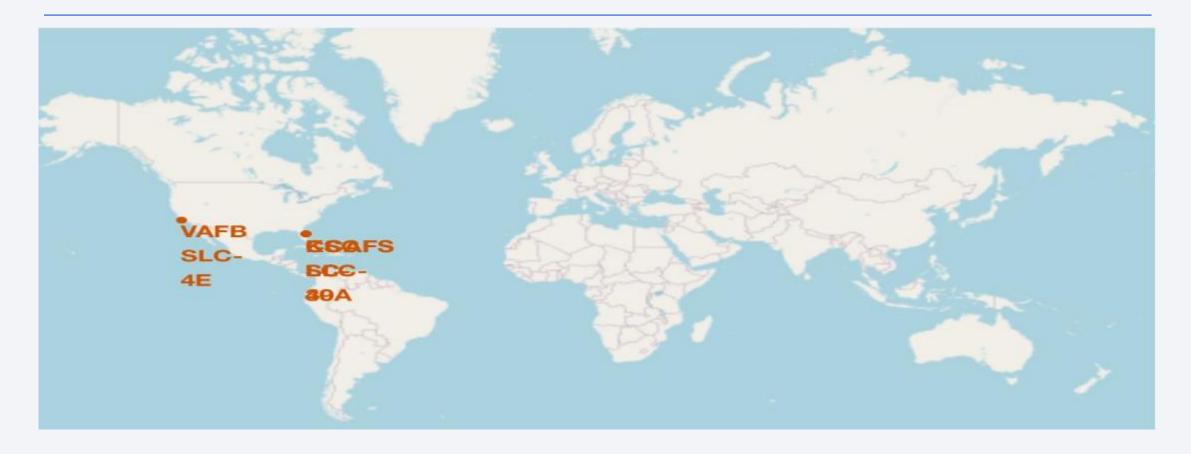

Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

Out[45];	Landing_Outcome	COUNT_LAUNCHES		
	No attempt	10		
	Success (drone ship)	5		
	Failure (drone ship)	5		
	Success (ground pad)	3		
	Controlled (ocean)	3		
	Uncontrolled (ocean)	2		
	Failure (parachute)	2		
	Precluded (drone ship)	1		

- We selected Landing outcome sand the COUNT of landing outcomes from the data and-used the WHERE clause to filter for landing outcomes between 2010-06-04 to 2010-03-20.
- We applied the group by clause to group the landing outcomes and the order by clause to order the grouped landing outcomes in descending order.

All launch sites global map markers

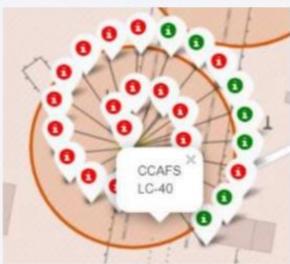

We can see that the Space launch sites are in the United States of America coasts.
 Florida and California

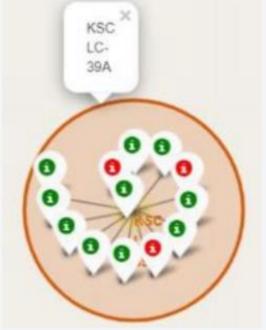

Markers showing launch sites with color labels

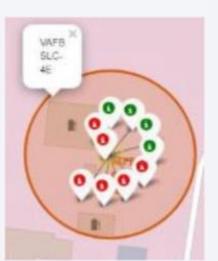

Green marker showing **Successful** Launches. Red marker showing **Unsuccessful** Launches.

Launch Site distance to landmarks

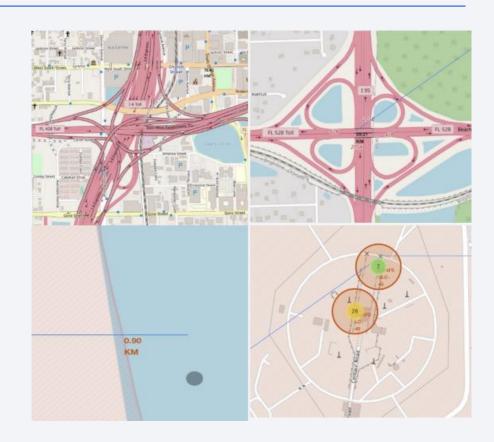

Are lunch sites is close proximity to railways?

No

Are lunch sites is close proximity to highway?
 No

Are lunch sites is close proximity to coastline?
 Yes

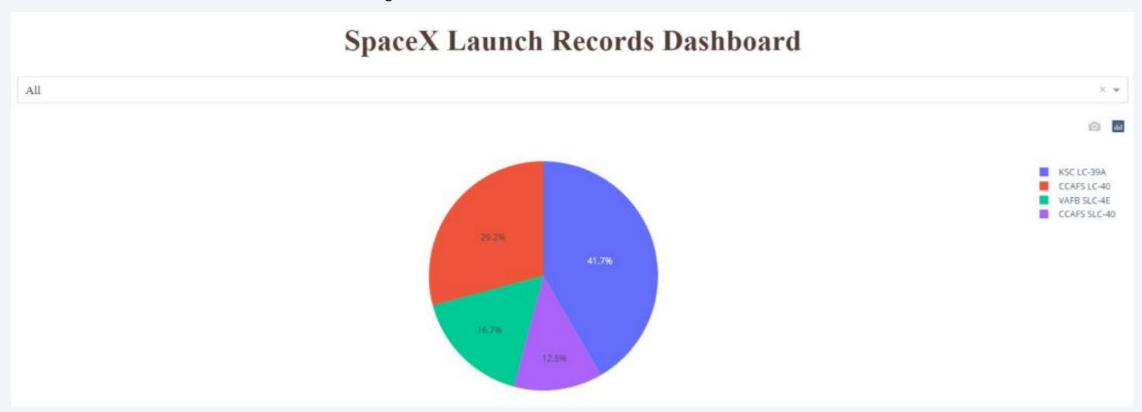

Do launch sites keep certain distance away from cities?
 Yes

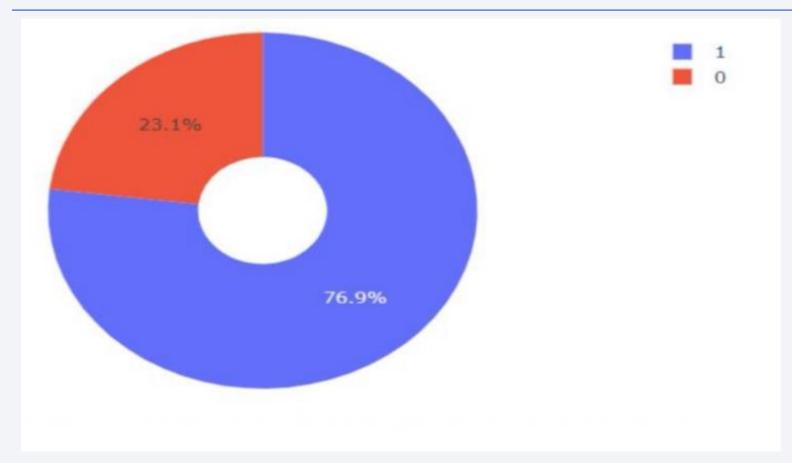

Pie chart showing the success percentage

Total success launches by all sites

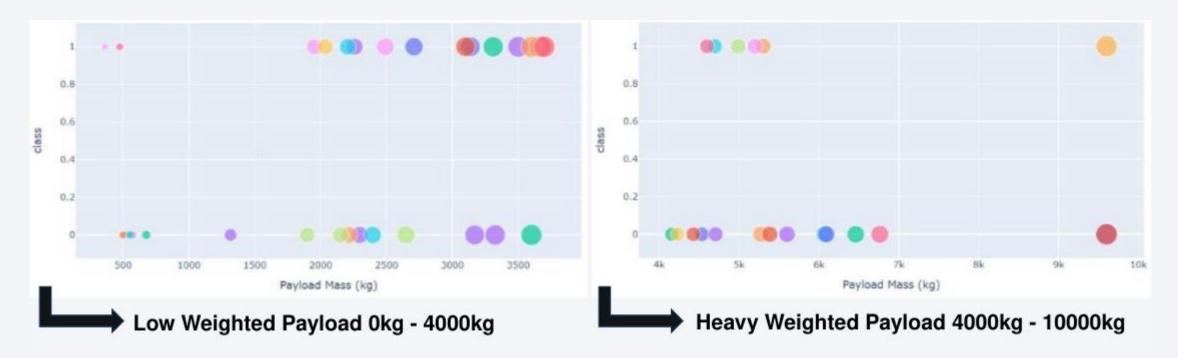

Pie chart showing the Launch site with the highest launch success ratio

• KSC LC-39A achieved a 76.9% success rate while getting a 23.1% failure rate

Scatter plot of Payload vs Launch Outcome for all sites, with different payload selected in the range slider

• We can see the success rates for low weighted payloads is higher than the heavy weighted payloads.

Classification Accuracy

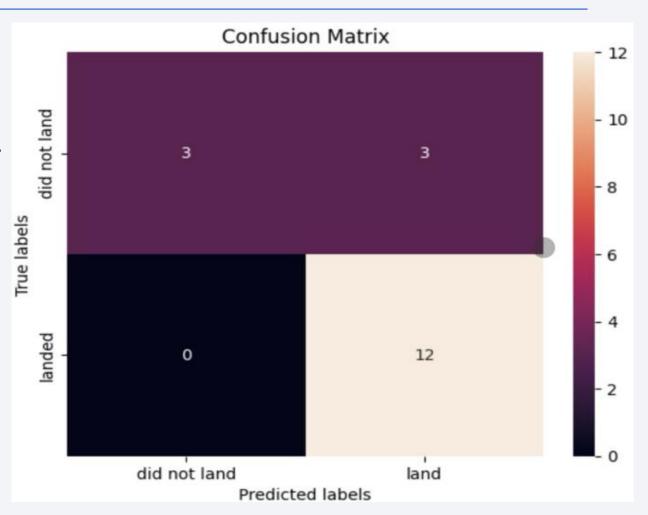

• The decision tree classifier is the model with the highest classification accuracy

```
In [46]:
    algorithms = {'KNN':knn_cv.best_score_,'Tree':tree_cv.best_score_,'LogisticRegression':logreg_cv.best_score_}
    bestalgorithm = max(algorithms, key=algorithms.get)
    print('Best Algorithm is ',bestalgorithm,'with a score of',algorithms[bestalgorithm])
    if bestalgorithm == 'Tree':
        print('Best Params is :',tree_cv.best_params_)
    if bestalgorithm == 'KNN':
        print('Best Params is :',knn_cv.best_params_)
    if bestalgorithm == 'LogisticRegression':
        print('Best Params is :',logreg_cv.best_params_)

Best Algorithm is Tree with a score of 0.8767857142857143
Best Params is : {'criterion': 'entropy', 'max_depth': 2, 'max_features': 'sqrt', 'min_samples_leaf': 4, 'min_samples_split': 2, 'splitter': 'random'}
```

Confusion Matrix

• The confusion matrix for the decision tree classifier shows that the classifier can distinguish between the different classes. The major problem is the false positives .i.e., unsuccessful landing marked as successful landing by the classifier.

Conclusions

• We can conclude that: The larger the flight amount at a launch site, the greater the success rate at a launch site. Launch success rate started to increase in 2013 till 2020. Orbits ES-L1, GEO, HEO, SSO, VLEO had the most success rate. KSC LC-39A had the most successful launches of any sites. The Decision tree classifier is the best machine learning algorithm for this task.
